Spottr

Bodyweight coaching on iPhone and Watch

Short workout feedback needs fresh evidence.
The user stays in control of the set.

OxHack 2026

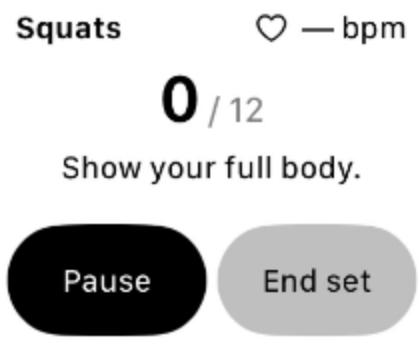

iPhone simulator

The workout flow

01	**Choose the work**	Goals, weekly target and an approved workout.
02	**Track the set**	Camera cycles for push-ups and squats. Manual logs and hold timers for the wider library.
03	**Respond in the moment**	A concise cue, visible controls and optional local voice. Pause or stop at any time.
04	**Review the record**	Actual sets, source labels and timings. Ask for an AI summary with an explicit tap.

Phone, Watch and optional side camera

Simulator capture
Physical sensors pending

Session authority

On-device pose inference
Rep and rest timing
Cue priority and expiry
Local workout history

Capture companion

HTTPS pairing verified
Real initial frames
USB disconnect blocks sustained capture

Timing decisions use observed evidence

Complete cycles count

Top, bottom, then top. A gap above 0.75s resets movement.

Pacing uses prior reps

After five valid reps, flag duration above mean + max(sample SD, 0.25s).

Stop takes priority

Discomfort ends encouragement. Pause and end cancel late cues.

Sensor time stays explicit

Missing or stale Watch readings remain unavailable.

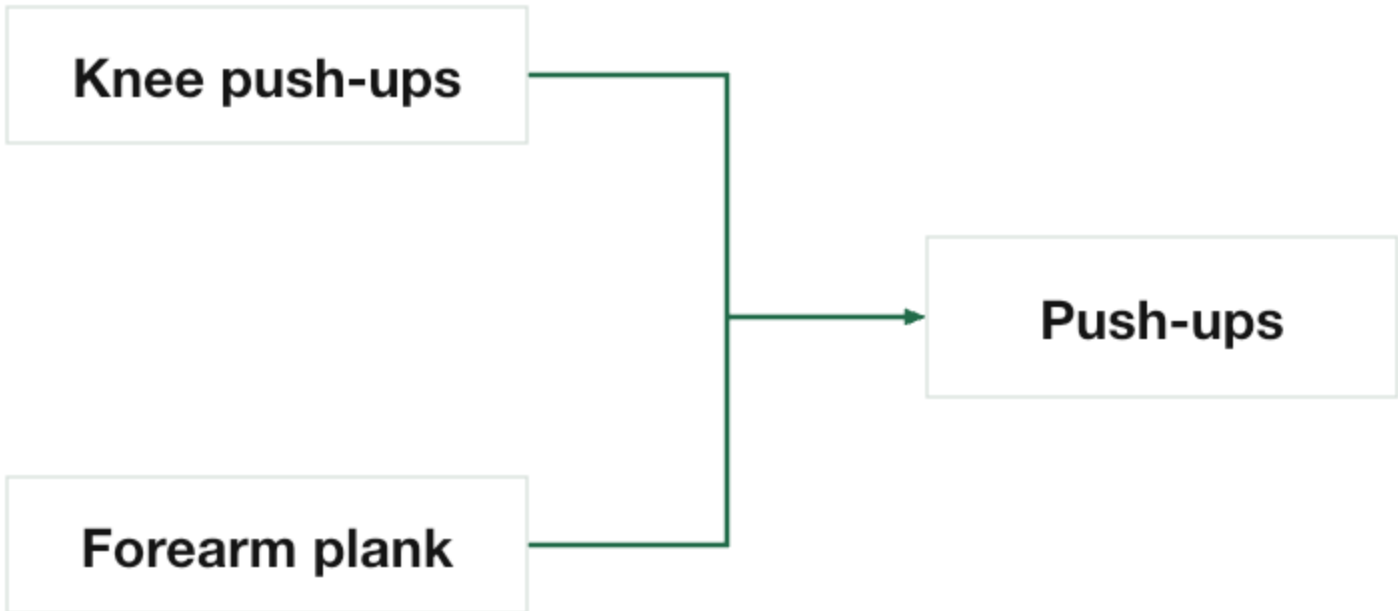

Illustrated phases

Skills make recorded progress visible

19 exercises. Connected tree or linear list.

3 qualifying sets across 2 days

All prerequisites complete.
Practice remains open.
Sources stay visible.

Replay and discomfort
do not earn completion.

One unlock example

Four Gemini requests share a grounded contract

01 **Chat**

02 **Workout proposal**

03 **Session summary**

04 **Weekly summary**

Explicit facts and preferences

Recorded sets and source labels
Selected goals and weekly target
Bounded exercise catalogue

Checked before use

Fact IDs and typed quantities
Current generation only
User approval before a plan starts

All four gateway types returned 200 with synthetic facts. Native provider acceptance pending.

Operational data and batch analysis

Tiger Data

Operational history

Proposed role
Timestamped workout events
and rolling aggregates

Adapter and migration tests pass.
Strict TLS blocks live SQL.

Snowflake

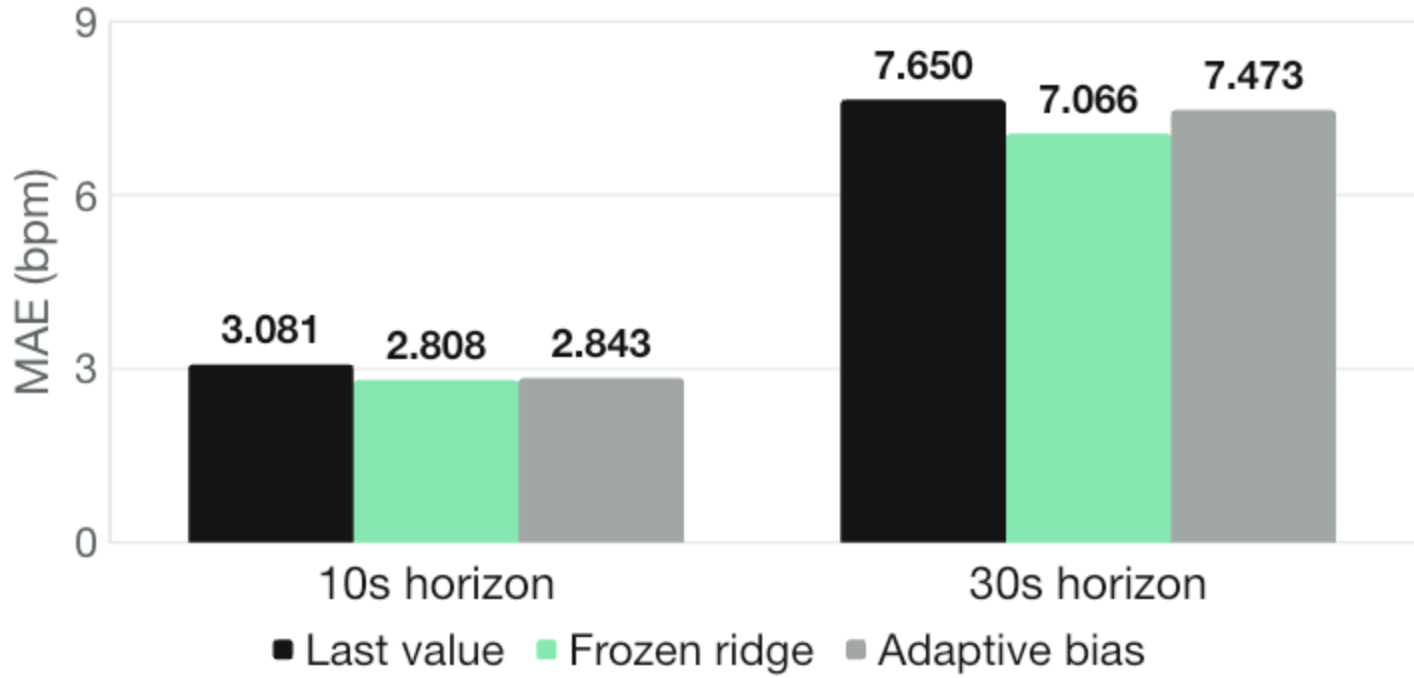

Batch evaluation

Proposed role
Versioned evaluation tables
and offline error analysis

SQL API adapter tested with doubles.
Live statement acceptance pending.

An HR forecast with a locked participant test

Future 5s mean HR, using the previous 60 seconds

Test coverage

Participants 108 / 109

10s: 803 + 4 forecasts
30s: 799 + 0 forecasts

The adapter increased error

Exploratory public-data result. Only one person contributes at 30s. No Watch or failure validation.

Provider evidence and remaining gates

Track	Evidence now	Remaining gate
Gemini	4 gateway types: HTTP 200	Native acceptance and factual review
Tiger Data	Service provisioned	Strict TLS private-CA chain
Snowflake	SQL adapter tested	Credentials and a bounded live statement
Vultr	Packaging prepared	Credit/spend scope and deployment
ElevenLabs	Local Apple speech only	API secret and audible acceptance
Presage	SDK plan prepared	Vitals egress decision and credits
Delta	Judge packet prepared	Operator/legal step, then one review

Local workouts remain usable while optional providers are pending.

A two-minute demo of the implemented flow

00:00	**Today and goals**	Show the actual starting state.
00:15	**A tracked workout**	Show the camera path and visible cue. Label any fixture.
00:55	**Pause, end and review**	Keep controls available and preserve source labels.
01:20	**Skills and Coach**	Show prerequisites, then an explicit request action.
01:45	**Evidence and next gates**	Use the saved HR result and current provider status.

App Store profiles are ready. Archive, SDK validation, upload and TestFlight remain pending.
